ACKNOWLEDGEMENTS

I wish to express my gratitude to the following people who generously gave their help and time throughout the course of this study.

To Dr. Shirley C. Baird, Committee Chairman, I extend my heartfelt thanks for her continuous guidance and loving support. She challanged me with the impossible made probable because of her astute direction.

To Dr. William F. Duer, Committee Member and my right hand man, I extend my sincerest thanks for his expertise, optimism, and for his belief in my study. Both he and Dr. Baird were the silver linings in every cloud.

To Dr. Vera Harmon and Suzanne M. Jaax, Committee Members, for their objective and valuable suggestions offered to improve my study.

To the administrators and nurses of the Texas Nurses Association, District 9, who provided their perceptions of the clinical dietitians competencies, without which I would have no completed study.

To my wise and loving parents, Harrell T. and Roberta L. Ford, for the many opportunities of growth they have provided me.

To Philip A. Lorenz, my fiance, for his never yielding patience, encouragement and love.

and

To God, my provider of faith, hope and miracles.

May you all share in the enrichment I've obtained through your selfless efforts.

Introduction

Butterworth (1979) asked the question, "How can nurses and dietitians work together more efficiently to promote the health and welfare of the hospital patient?" In a study reported by Spangler (1971), dietitians experienced frustration in regard to relationships with other members of the interdisciplinary team such as physicians and nurses. The greatest problems encountered by the interdisciplinary team seem to come from the conflicts regarding professional roles (Ducanis and Golin, 1979). These conflicts result from overlapping responsibilities and competencies. "Misunderstanding among health professionals about each other's educational preparation and roles is a serious barrier to effective teamwork in our fast changing health education and delivery systems" (Soulary and Tanner, 1972). According to Odhner (1970). "breakdowns in the team process are frequent enough to suggest that understanding and improving this process should become a more conscious part of the technology of health professionals." "It would seem that additional information regarding the mutual perceptions of various professionals involved in interdisciplinary teamwork would be helpful in further studying the operation of the team" (Ducanis and Golin, 1979). It is those mutual perceptions of competencies and agreed upon roles that will

contribute to teamwork cohesion.

It is important that the physician, nurse (team members who have the greatest contact with the hospital patient) and the dietitian share a common awareness of the dietitian's competencies so they may more easily reach an agreement on how to utilize her skills in efficient coordination with their own. As the dietitian and interdisciplinary team educator realize the conceptions and misconceptions the physician and nurse have about the dietitian's competence, the information can be used as an educational component aimed at strengthening the congruency of perceptions among members of the interdisciplinary team. This component should be utilized within any of the following three phases of education: "...initial preparation, continuing education, and the exchange of knowledge between professionals" (Ducanis and Golin, 1979).

Problem Statement

The purpose of this study was to determine the perceptions of nurses concerning the competence of the clinical dietitian and to compare those with what the physicians perceived about clinical dietitians' competence. The specific problem investigated was: To what extent is there congruency between dimensions of the perceptions of the clinical dietitians' competence, as held by physicians and nurses?

Historical Perspective

A high incidence of malnutrition in the hospital patient exists (Butterworth, 1974). One of the major contributing factors in the hospital setting is that members of the health care team have not been aggressive enough in evaluating the patient's individual nutritional needs and assuring that he has proper nutriment (Ford, 1979). Butterworth (1974) specifically cites reasons for neglected nutritional care; these include diffusion of responsibility for patient care, lack of communication and interaction between physician and dietitian, and failure to record height and weight.

Each undesirable practice reflects misunderstood roles and inadequate teamwork. Ambiguous roles create performance gaps, duplication, rivalry, confusion and hesitancy to act (Given and Simmons, 1977; Brill, 1979; Holland, Knobel, and Parrish, 1976). These undesirable characteristics increase the potential for low quality work, personal tension and conflict. Communication diminishes, resulting in exclusion of individual professionals from seeking needed guidance and direction from other team members (Given and Simmons, 1977). Vagueness about roles and inappropriate expectations held by one professional about another can cause complications in the smooth functioning of an interdisciplinary team (Given and

Simmons, 1977). This may indeed be the case between dietitians, nurses and physicians.

Ducanis and Golin (1979) studied the perceptions of physicians, nurses, and "own" profession by administering an "Interprofessional Perception Scale" to allied health professionals—including nutritionists. Results indicated that the subjects perceived both physicians and nurses to be well trained and competent, but not understanding or fully utilizing the capabilities of the various allied health professionals. Additionally, many of the allied health professionals did not think that physicians or nurses agreed with or would understand their views on these issues. Such results are not surprising. "Potential misperceptions and misunderstandings are usually greater between than within professions because the professional is not really aware of the specific competencies and roles of members of different professions" (Ducanis and Golin, 1979).

A study of curricula in allied health disciplines conducted by the Faculty Committee for Allied Health Interdisciplinary Education found a general lack of understanding of total allied health capabilities in individual areas of specialization (Verstraete, Scudder, Karner and Meier, 1978). The problem applied equally to faculty and students. In a Ducanis and Golin study (1979) only 34 percent of the

professional schools surveyed actually offered a course for teaching the functions of the health care team. A large proportion of the respondents realized the need for such educational curricula, and 79 percent had considered such a course or unit.

"Shared understanding and acceptance of role definitions by members of the team is predicated to obtain a clear division of labor -- a condition for the effectiveness of teamwork" (Nagi, 1975). To facilitate role definitions, job descriptions must be clearly defined (Brill, 1979) "in terms of the particular professional competencies of each team member" (Ducanis and Golin, 1979). In other words, competencies provide the framework for building roles. Competencies are the skills and knowledge required to perform. Once the skills and knowledge of each team member are commonly understood, negotiation of role assignments is much easier. Furthermore, the individual team member becomes more cognizant of the boundaries of his specialty field and functions in a relationship to others' knowledge and skills. He becomes more able and willing to accept and defer to another team member's expertise.

The ideal interdisciplinary patient-care team has developed a joint plan in which each member makes a unique but complementary contribution to needed services. "Joint planning

enables team members to reinforce each other's activities and maximize each other's efforts" (Given and Simmons, 1977).

Collaboration must exist between interdisciplinary health—

care professionals as a means of eliminating gaps and over—

laps in service (Mason and Parascaudola, 1972).

In addition, "When the common bases of functions and the skills and knowledge required to perform those functions are identified, then certain generic educational curricula can be designed to fit them" (Pellegrino, 1977). For years past and present, health professionals have described the need for core curriculum aimed at unification of the health professions, including dietitians, physicians, and nurses. Individual and segregated educational preparation hinders teamwork between the various professionals involved in the delivery of health care (Given and Simmons, 1977). Shared experiences reduce uncertainties and communication barriers and provide common referents so that needed exchange can occur (Given and Simmons, 1977). Therefore, the "Health Field Concept" recommends the development of courses which encourage the joint training of students in the various health disciplines (Holland, Knobel, and Parrish, 1976).

Because alliance in patient care can be strengthened when based on a mutual understanding of all health occupations, it is wise to identify the skills and knowledge of all

interdisciplinary teammates within this "joint training."

Information concerning congruent and noncongruent perceptions of the dietitians' competence, as viewed by the nurse and the physician, can be useful in developing common educational curricula for all three professionals. The information should be used in "joint training" within higher learning institutions and as continuing or inservice educational programs. Subject matter should emphasize controversial perceptions in an effort to increase the congruency of perceptions between the three disciplines. For the power of the interdisciplinary health care team to promote health and well being lies not in each team member's separate perceptions alone, but in the sum of its congruent perceptions.

Hypothesis

The null hypothesis tested in this study was: There is no recognizable difference between the physicians' and nurses' perceptions of the clinical dietitians' competencies. The differences noted were observed and reported intuitively and through charts and tables.

Methods and Procedures

Questionnaire

A questionnaire was developed to assess physicians perceptions of various competencies of dietitians in a

preliminary study by Carter (1979). The questionnaire was validated using a modified Delphi Technique. In order to estimate the reliability of the questionnaire, results of factor analysis were used. In particular, Cronbach's alpha coefficient -- a by product of factor analysis, yields a lower based estimate of reliability (Cronbach, 1953). Five competencies for each of six dimensions of dietetics were included in the questionnaire. These six dimensions were: (1) foodservice systems management; (2) medical knowledge; (3) knowledge of food composition; (4) counseling and education; (5) diet therapy, of the nature commonly considered to be the responsibility of the dietitian; and (6) diet therapy, of the nature commonly considered to be the responsibility of the physician (see Appendix A). Physicians in the Carter Study were given the thirty randomly sequenced competencies and were asked to rank them according to the level of competency expected of clinical dietitians. The current study utilized the same questionnaire (see Appendix B) and procedure to measure the nurses! perception of the competence of the clinical dietitian. Sampling

The population consisted of all nurses who are members of the Texas Nurses Association, (TNA), District 9. Using

a table of random numbers, a sample of three hundred seventy-one nurses was selected from the 1980 TNA membership list. The total sample was approximately the same size and drawn from the same city area as that used in the Carter Study (1979).

Collection of Data

Upon approval of the Human Subject Review Committee of Texas Woman's University, each subject was mailed the questionnaire with a cover letter (see Appendix B) explaining the study and a self-addressed envelope. Statistical Analysis and Extraction of Factors

Factor analysis was used to analyze the data obtained through the questionnaire. Statistical programs available in the SPSS library were employed using the Texas Woman's University DEC 2050 system. "Usually the aim of factor analysis is to summarize the interrelationships among the variables in a concise but accurate manner as an aid in conceptualization" (Gorsuch, 1974). Analysis resulted in clustering the questionnaire items into factors representing the dimensions of dietetics perceived by both physicians and

The description and interpretation of these dimensions is based on the essence of the competency statements which clustered to constitute the respective factors.

nurses. According to Carter (1979):

The six theoretical dimensions of dietetics (see Appendix A) devised by Carter (1979) were also considered in describing the factors obtained through factor analysis.

In the Carter Study (1079), the data file was first factor analyzed with no limitations on the number of factors. An output of six factors resulted. However, application of the Scree test produced an optimal number of three factors (Carter, 1979). The same number of factors (3) was adopted in the current study to determine the perceptions of nurses so that those perceptions could be compared to those of the physicians. The raw factor matrix was rotated orthogonally using Kaiser's Varimax.

The minimum acceptable number of usable returns for factor analysis in this study was based on the formula of two times the number of items on the survey instrument plus one. The basis for estimating sample size represents an estimation of "v" means and "v" variances plus one general factor (Baird, 1977).

Visual interpretation was used to compare the two factor structures of the physician and nurse analyses to determine the degree to which the two analyses were related.

Results and Discussion

Responses

Forty-four percent (162) of the usable questionnaires

were returned. Therefore the number of responses exceeded the minimum acceptable number of sixty-one. Additionally, this return exceeded the usable return from physicians in the Carter Study (1979) by six percent.

Description of Factors

The competency statements belonging to Factor I, along with their factor structure coefficients and theoretical factor numbers are presented in Table 1. Factor I includes those dimensions of dietetics generally regarded as the more modern roles of dietitians perceived by nurses. this study, all competencies identifying medical knowledge loaded highly on Factor I. Load is a measure of saturation on one particular factor (Kerlinger, 1973). Four of five competencies each in both dimensions of diet therapy loaded on the same factor. Therefore, diet therapy of the nature commonly considered by the developers of the questionnaire (Carter, 1979) to be the responsibility of dietitians and physicians was perceived as a modern component. The foodservice systems management competency of determining forecasting requirements for food production needs was labeled as a lower modern competency. All competency statements were of univocal nature, i.e., they loaded only on one factor.

Rank Order of Factor Structure Coefficient	Factor Structure Coefficient	Competency	eoretical Factor Vumber
1	.810	14. Knowledge of impli- cations of each stage of liver disease.	2
. 2	•742	12. Ability to assess nutritional status using anthropometric and biochemical indices.	5
3	• 735	20. Knowledge of implications of inborn errors of metabolism.	2
L ₊	•734	25. Knowledge of the pathology of athero-sclerosis.	, 2
5	•702	13. Knowledge of composition and indicated use of total parenteral nutrition.	6
6	•693	27. Ability to determine level of sodium restriction based on patient's medical status.	6
7	•676	26. Knowledge of food and drug interaction.	2
8	•629	4. Knowledge of the etiolog diagnosis, and treatment of malabsorption.	y , 2

9	• 591	28. Knowledge of diet adjustments necessary for patients with cardio-vascular disease.	5
10	• 565	11. Knowledge of dietary implications of gastro-intestinal surgery.	6
11	• 470	7. Ability to calculate the amount of protein, potassium, sodium, and fluid which should be prescribed for the diets of renal patients.	6
12	• 464	23. Determines the basis for forecasting requirements for food production needs.	- 1
13	•417	1. Knowledge of composition and indicated use of commercial tube feeding formulas.	5
14	•412	29. Ability to recognize indications for commercial diet supplement products.	5

The competency statements belonging to Factor II, along with their factor structure coefficients and theoretical factor numbers are presented in Table 2. Factor II includes those dimensions of dietetics generally regarded as

the more traditional roles of dietitians perceived by nurses. All competencies in the dimension of food composition loaded on Factor II. A foodservice systems management competency item about planning menus exhibited a high factor structure coefficient of .695. One competency each in the dimensions of diet therapy of the nature commonly considered to be the responsibility of the dietitian and diet therapy of the nature commonly considered to be the responsibility of the physician (with the lowest factor structure coefficient of .473) loaded on Factor II. These concerned the determination of nutritional requirements during pregnancy and lactation and the calorie level and carbohydrate distribution for diabetics. All competency statements were of univocal nature.

Factor II: Traditional Role of Dietitians

5	• 574	6. Ability to analyze menus for the nutritional adequacy and modify them as necessary.	3
6	• 558	10. Knowledge of food item to be restricted on a glute free diet.	
7	•489	2. Analyzes previous nut- rient intake of individuals for nutritional adequacy as compared to recommended allowances.	
8	• 473	19. Ability to determine calorie level and carbo-hydrate distribution for diabetic patients.	6

The competency statements belonging to Factor III, along with their factor structure coefficients and theoretical factor numbers, are presented in Table 3. Factor III

includes those dimensions of dietetics generally regarded as those of counseling and education as perceived by nurses. All five competencies in the dimension of counseling and education load on Factor III. Therefore nurses did indeed see a separate component as counseling and educational skills and knowledge. Two competencies in the dimension of foodservice systems management loaded among the lowest three competencies identified in this factor. Again, all competency statements were univocal.

Table 3
Factor III: Counseling and Education

	Factor Structure Coefficient	Competency Statement	Theoretical Factor Number
1	•742	17. Skill at conducting group classes for nutriti education.	4

5	• 557	9. Develops standardized recipes to provide a consistent basis for quality and quantity control.	1
6	• 539	5. Ability to compose diet instruction material.	4
7	• 538	21. Plans for ensuring patient satisfaction with foods presented during traservice.	1

In turn, the physicians identified the same three dimensions of dietetics—modern, traditional, and counseling and education, but with heavier emphasis on the traditional factor than the modern. In the case of the physicians, traditional was Factor I and modern was Factor II. For another comparison aspect, the physicians' study did not produce the "factorially pure" data obtained in the nurses' study. Kerlinger (1973) stated, "If a test measures one factor only, it is said to be factorially pure."

Additionally, while the nurses perceived all five competency statements from the theoretical dimension of

counseling and education, the physicians only perceived one with a factor structure coefficient above .400. In contrast, the physicians appeared to be seeing more foodservice systems management items (viewed as traditional by the investigator) correctly within the traditional factor.

Upon viewing the Table of Means and Standard Deviation (see Appendix C) it is apparent that standard deviation is much greater for physicians than nurses. In other words, it appears that the nurses' perceptions were more congruent within their group of respondents than those of the physicians'. The mean values for nurses' perceptions began and ended higher than those of the physicians'. This indicated that nurses have a higher appreciation of dietitians' skills and knowledge overall.

On the whole, perceptions of dietitians' competencies were very similiar between nurses and physicians. However, some individual competency items warrant attention. For example, nurses perceived considerably greater competence from dietitians than physicians perceived about the following items: 4, 20, 14, 25, and 19. These items all dwell within the theoretical dimensions of medical knowledge and diet therapy, of the nature commonly considered to be the responsibility of the physician. For example, nurses felt dietitians were much more competent at determining calorie

level and carbohydrate distribution for diabetic patients than physicians did. This ambiguity may cause conflicts if the nurse seeks the assistance of the dietitian instead of the physician who feels that particular role is his territory. On the other hand, physicians perceived the dietitians ability to counsel obese patients on behavior modification to promote weight loss at a much higher level than did the nurses.

Summary and Conclusions

The results of this study indicate that nurses and physicians both recognize the same three dimensions of dietetics practice--traditional, modern, and counseling and education.

This could be due to the close collaborative dealings the physician and nurse encounter while providing health services. However, the nurses' perceptions of the three dimensions of dietetic practice are more clean and distinct. The nursing respondents' perceptions of dietitians is more congruent within itself.

Although congruency of perceptions exists within the three factors which Carter (1979) labeled traditional, modern, and counseling and education, Factor I in the current study may be more appropriately labeled "Physiological Factors."

Indeed, the majority of competency statements loading on this factor include a component of physiological knowledge. More

specifically, understanding of the body and disease processes and diet in relationship to these processes is identified. Factor II may be more appropriately labeled "Food and Nutrient Composition." Competency statements loading on this factor identify an understanding of food sources in relationship to nutritional requirements.

It is an encouraging result that these two interdisciplinary team members (nurses and physicians) perceive similiar competencies in dietetics. Their shared understanding promotes the efficiency of their teamwork in promoting the patient's health and well-being.

However, inadequacies between nurse and physician relationships have been widely noted (Soulary and Tanner, 1972). Some more specific discrepancies persist in their perceptions of dietitians' competence, especially in the theoretical dimension of medical knowledge. These specific perceptions should receive extra attention when used as a basis for educational programs aimed at promoting congruent perceptions of competencies between team members.

Implications for Further Study

Information concerning the congruency of perceptions about professional competence is indeed useful in studying the interdisciplinary team and in discovering ways to strengthen its collaborative efforts. Therefore, similiar

surveys should be performed in the future. They should measure the interprofessional perceptions of the competence of all members of the health care team.

However, questionnaires utilized should be developed with improvements on the one utilized in the Carter (1979) and the current study. Caution should be taken to delineate key words which clue the subject in to a profession's area of expertise. For instance, the word "diet" or "food" in a questionnaire item could cause a subject ranking dietary skills to place a higher rating of competence with that particular item. Additionally, questionnaires should be worded to exclude terms nonfamiliar to the surveyed persons. For instance, nurses in the current study had questions as to the term "anthropometric." This may have caused a lower ranking of competence perceived by those surveyed.

Once stronger survey instruments are developed, the knowledge obtained through their use could be used as an improved evaluative basis for education aimed at strengthening congruent perceptions between all members of the interdisciplinary team.

APPENDIX A

DIMENSION 1: Food Service Systems Management COMPETENCIES: YES NO Plans menus which incorporate principles 1 of good menu planning. 2. Plans for ensuring patient satisfaction with foods presented during tray service. Determines the basis for forecasting 3. requirements for food production needs. Develops food purchasing specifications 4. which insure quality and quantity control. 5. Develops standardized recipes to provide a consistent basis for quality and quantity control.

DIMENSION 2: Medical Knowledge

COMPETENCIES: 1. Knowledge of implications of each stage of liver disease. 2. Knowledge of the etiology, diagnosis, and treatment of malabsorption. 3. Knowledge of implications of inborn errors of metabolism. 4. Knowledge of the etiology of atherosclerosis. 5. Knowledge of food and drug interaction.

DIMENSION 3: Knowledge of Food Composition

COM	PETENCIES:	VDC	310
1.	Knowledge of foods which are high sources of potassium.	YES	
2.	Knowledge of nutrients likely to be deficient in a vegetarian's diet.		
3.	Analyzes previous nutrient intake of individuals for nutritional adequacy as compared to recommended allowances.		
4•	Ability to analyze menus for their nutritional adequacy and modify them as necessary.		,
5•	Knowledge of food items to be restricted on a gluten-free diet.		

DIMENSION 4: Counseling and Education

COMPETENCIES: YES NO Skill at conducting group classes for nutrition education. Ability to counsel obese patients on 2. behavior modification to promote weight loss. Knowledge of techniques which may motivate 3. patients to dietary compliance. Ability to compose diet instruction 4. materials. Ability to include social and cultural 5. factors into diet instruction.

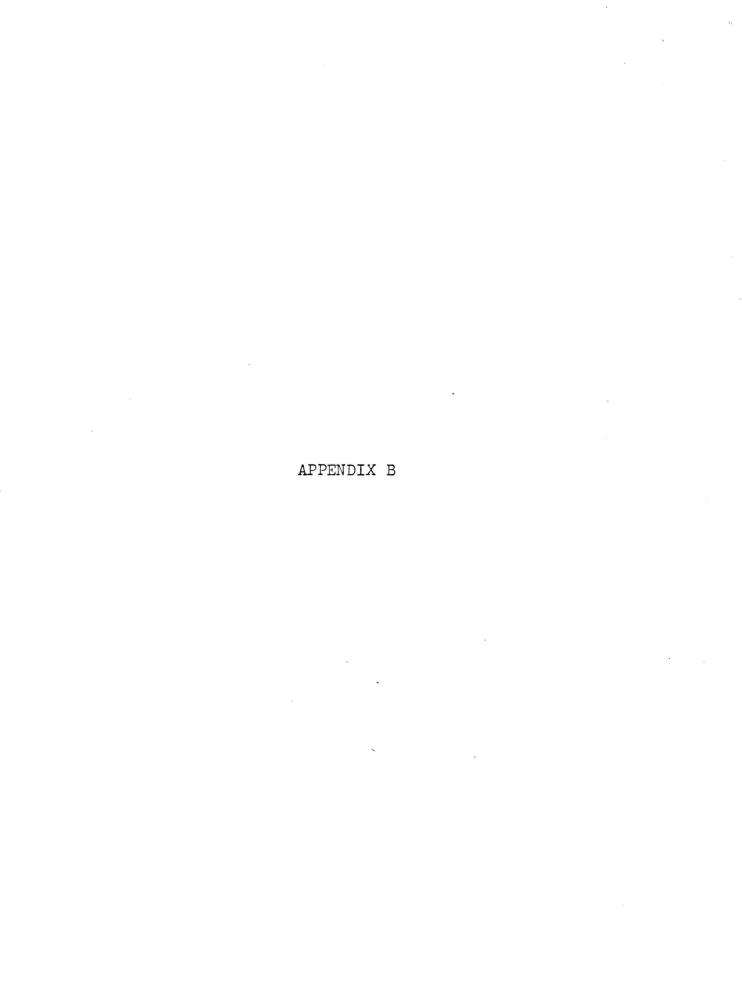

DIMENSION 5: Diet Therapy, of the Nature Commonly Considered to be the Responsibility of the Dietitian

COM	PETENCIES:	
1.	Ability to recognize indications for commercial diet supplement products.	YES NO
2.	Knowledge of diet adjustments necessary for patients with cardiovascular disease.	
3.	Ability to determine nutritional requirements during pregnancy and lactation.	
! +•	Ability to assess nutritional status using anthropometric and biochemical indices.	
5•	Knowledge of composition and indicated use of commercial tube feeding formulas.	

DIMENSION 6: Diet Therapy, of the Nature Commonly Considered to be the Responsibility of the Physician.

COMPETENCIES:

COM	COMPETENCIES:			
1.	Ability to calculate the amount of protein, potassium, sodium, and fluid which should be prescribed for the diets of renal patients.	YES	NO	
2.	Knowledge of composition and indicated use of total parenteral nutrition.			
3.	Knowledge of dietary implications of gastrointestinal surgery.			
4.	Ability to determine level of sodium restriction based on pateint's medical status.			
5.	Ability to determine calorie level and carbohydrate distribution for diabetic patients			

October 22, 1980

Dear Nurse:

I need your help! I am a candidate for a M.S. in Nutrition at Texas Woman's University. For my research I am attempting to assess whether congruency exists between the perceptions of clinical dietitians' competencies as held by physicians and nurses.

I would greatly appreciate it if you would complete the brief, thirty item questionnaire enclosed. The questionnaire asks you to rank the thirty items according to the level of competency you expect of dietitians. Please realize that your name is not required on your returned questionnaire. However, in case of inadequate return, a code list will be utilized for return follow-up. The list will be placed in a locked file in the Department of Nutrition office and destroyed upon completion of this study.

The statement below is required to comply with the Human Subjects Review Committee of Texas Woman's University:

No medical service or compensation is provided to subjects by the university as a result of injury from participation in research. I UNDERSTAND THAT MY RETURN OF THIS QUESTIONNAIRE CONSTITUTES MY INFORMED CONSENT TO ACT AS A SUBJECT IN THIS RESEARCH.

If you have had little or no experience working with dietitians, I still need your opinion. I will be happy to answer any questions by phone - 667-7720. The results of this survey are contingent on your help. A stamped, self-addressed envelope is enclosed for return. Your response is greatly appreciated.

Sincerely,

Note:

Improper release of

this data is a potential risk.

Mary Dell Ford
